China's accession to the World Trade Organization (WTO) has been hailed as the biggest coming-out party in the history of capitalism. Its membership eventually will contribute to higher standards of living for its citizens and increased growth for its economy. But why would the Chinese communist regime voluntarily agree to comply with the many complex rules of the global trading system since it has already become the world's seventh largest trading country while avoiding these constraints by remaining outside the system? The answer to this question forms the basis for this new book. Nicholas Lardy explores the many pressures on the Chinese government, both external and internal, to comply with the standards of the rule-based international trading system. Lardy points out that, prior to entry into the WTO, China enjoyed high growth rates and more foreign direct investment than any other emerging economy. He draws on a wealth of scholarship and experience to explain how China's leadership expects to leverage the increased foreign competition inherent in its WTO commitments to accelerate its domestic economic reform program, leading to the shrinkage and transformation of inefficient, money-losing companies and hastening the development of a commercial credit culture in its banks. Lardy answers a number of other questions about China's new WTO membership, including its effects on bilateral trade with the United States; the possibility that China will use its power to reshape the WTO in the future; the degree to which the terms of China's entry were more or less demanding than those for other new members; the ability of China's economy to successfully open to new imports; and the prospects for new growth in various sectors of China's economy made possible by WTO accession. This book will become an important tool for those who wish to understand China's new role in the global trading system, to take advantage of the new opportunities for investment in China, or simply to gain a better understanding of what former President Clinton called a "once in a generation event."

Maximum PC is the magazine that every computer fanatic, PC gamer or content creator must read. Each and every issue is packed with punishing product reviews, insightful and innovative how-to stories and the illuminating technical articles that enthusiasts crave. Examining the flow of technical knowledge between the US, Taiwan and Mainland China over the last sixty-five years, this book shows that the technical knowledge that has moved between these states is vast and varied. It includes the invention and production of industrial goods, as well as knowledge of the patterns of corporate organization and management. Indeed, this diversity is reflected in the process itself, which is driven both by returning expatriates with knowledge acquired overseas and by successful government intervention in acquiring technology from multinational firms. Technology Transfer Between the US, China and Taiwan engages with the evolving debates on the merits, importance and feasibility of technology transfer in the process of economic development globally, and uses the example

of Taiwan to show that multinational corporations can indeed play a positive role in economic development. Further, it reveals the underlying tension between international cooperation and nationalism which inevitably accompanies international exchanges, as well as the delicate balancing act required between knowledge acquisition and dangerous levels of dependency, and the beneficial role of the US in East Asia's technological development. With contributors from disciplines ranging from history, geography, urban planning, sociology, political science and electrical engineering, this multi-disciplinary book will be of great interest to students and scholars working across a broad range of subjects including Taiwan studies, Chinese studies, economics, business studies and development studies.

Since the early 1980s, the cross-strait relationship between Taiwan and mainland China has exploded, driven by economic and political reforms. As a result, each would suffer great economic pain and dislocation in the event of a major disruption in that rapidly growing economic relationship. This monograph analyzes the political impact of that relationship and evaluates the prospects for Beijing to exploit it by employing economic coercion against Taiwan. This book presents a variety of research papers on factories' locations, city systems, and regional development. Consisting of three parts, it provides insights into the locational aspects of firms' activities from a strategic perspective. Part 1 discusses decision-making in the context of location, specifying the motivation for firms to move their factories provided by the corporate tax system. It also presents a case study from East Asia to clarify a mechanism by which firms move factories. Part 2 addresses city systems, offering theoretical clues to understanding why city systems are important to regional economies. It also clarifies from the empirical analysis the relations between city systems and the performances of regional economies. Part 3 investigates the topic of industrial parks, demonstrating how they form a basis for establishing industrial

clusters in regional economies. In addition, it examines the economic phases, such as economic disparity, generated in the process of development.
